

Acknowledgements

My deepest gratitude goes first to Professor Chin-Chi Chao, for her inspiring guidance throughout my research. She has accompanied me through my hardest time in the writing of this thesis. Without her encouragement and patient review, this thesis could not have reached its present form. For their reading of the manuscript and for insightful comments, I would like to thank Professor Chen-kuan Chen and Professor Yu-Feng Yang. I also greatly appreciate the financial aid from my government, whose fellowship gave me the chance to learn the software, ToolBook, from Professor Diane Slaouti of the University of Manchester.

Besides, I would like to thank the members in the CALL Study Group, my classmates in Manchester, and my student participants. Without their support, it is impossible to achieve this study. I also owe my gratitude to my best friends: Maggie, Alvin, and Diamond, who have accompanied me through my ups and downs. Last my thanks would go to my beloved family: my parents' confidence in me, my husband's understanding, and my new born daughter's cooperation. Their love is always there when I need most.
